DISCLAIMER

This report was prepared by a California Energy Commission staff person. It does not necessarily represent the views of the Energy Commission, its employees, or the State of California. The Energy Commission, the State of California, its employees, contractors and subcontractors make no warranty, express or implied, and assume no legal liability for the information in this report; nor does any party represent that the uses of this information will not infringe upon privately owned rights. This report has not been approved or disapproved by the California Energy Commission nor has the California Energy Commission passed upon the accuracy or adequacy of the information in this report.

ACKNOWLEDGEMENTS

The draft report, *Staff Forecast: Retail Electricity Prices*, 2005 to 2018, was prepared with contributions from the following Electricity Analysis Office staff:

- Mary Ann Miller
- Kurt Pisor
- Helen Sabet
- Ruben Tavares
- Nancy Tronaas
- Ron Wetherall
- Lana Wong

The Electricity Analysis Office staff gratefully acknowledges the technical assistance provided by Greg Broeking of R.W. Beck, Inc. in preparing retail price forecasts for the 13 publicly owned utilities and by Bob Logan in analyzing the sensitivity of retail electricity prices to changes in natural gas prices and providing overall guidance in the preparation of this report.

The staff also acknowledges the effort made by the staffs of Pacific Gas and Electric Company, San Diego Gas & Electric Company, Southern California Edison, Los Angeles Department of Water and Power, Sacramento Municipal Utility District, and the other publicly owned utilities in compiling the data needed to prepare these forecasts.

The staff also acknowledges the input provided by members of the California Municipal Rates Group in the design of this year's *Forms and Instructions for Publicly Owned Utilities* and by Wendy Keilani of SDG&E in the design of the *Forms and Instructions for Investor-Owned Utilities*.

Please cite this report as follows:

Marks, Mignon. *Staff Forecast of Average Retail Electricity Prices*: 2005 to 2018. California Energy Commission. July 2007. Publication number: CEC-200-2007-013-SD.

PREFACE

This draft staff report provides preliminary retail electricity price forecasts for California's 16 largest electric utilities. The forecast period is 2007 to 2018; staff also provided two years of historical prices, 2005 and 2006, for context. Retail price projections are presented for the residential, commercial, industrial, and agricultural customers of each electric utility.

The staff now welcomes public review and comment on these preliminary price forecasts from the utilities, ratepayer-advocate and public-interest organizations, and all other electricity market participants. On July 2, 2007, the staff will present these preliminary price forecasts to the California Energy Commission's Integrated Energy Policy Report Committee at its IEPR Committee Workshop on Staff's Preliminary Retail Electric Price Forecast. Written comments are encouraged. Please send them to the Energy Commission's Docket Unit bearing the following docket number: Docket No. 06-IEP-1H.

ABSTRACT

The California Energy Commission staff updated its biennial, 10-year forecast of average retail prices for California's 16 largest electric utilities. Statewide, average retail prices are projected to increase at an annual growth rate of 1.8 percent in nominal terms, but to decrease by 0.3 percent in (inflation-adjusted) real terms between 2005 and 2016. The utilities forecasted to have prices higher than California's system-average price in 2018 are the City of Glendale, San Diego Gas & Electric, City of Burbank, Southern California Edison, Pacific Gas and Electric, and Imperial Irrigation District. California publicly owned utilities forecasted to have the lowest system-average price in 2018 include Silicon Valley Power, Roseville, Sacramento Municipal Utility District, Turlock Irrigation District, and Anaheim. Retail prices are also forecasted for individual customer classes within each utility, including residential, commercial, and industrial customers.

Keywords: forecast, retail electricity prices, electric utilities, California

Executive Summary

This draft staff report compiles preliminary forecasts of retail electricity prices for the years 2007 through 2018. It also provides two years of historical prices, 2005 and 2006, for context. The price forecasts are expressed in average dollars per kilowatt-hour (kWh). The price forecasts are not utility *rate* forecasts.

State law, Senate Bill 1389 (Bowen), Chapter 568, Statutes of 2002, requires the California Energy Commission to assess the outlook for retail prices for electricity under current and expected market conditions. The Energy Commission uses these forecasts as an explanatory variable in its electricity demand forecast and as a metric for calculating the cost-effectiveness of proposed changes to the California Title 24 Buildings and Appliance Energy Efficiency Standards.

Energy Commission staff forecasted systemwide average retail prices for each the following electric utilities as well as for their residential, commercial, and industrial customers:

• Investor-Owned Utilities

- Pacific Gas and Electric
- Southern California Edison
- San Diego Gas and Electric

• Publicly Owned Utilities

- Sacramento Municipal Utility District
- ° Los Angeles Department of Water and Power
- ° Imperial Irrigation District
- ° Modesto Irrigation District
- Turlock Irrigation District
- ° City of Anaheim
- City of Burbank
- City of Glendale
- City of Pasadena
- City of Redding
- ° City of Riverside
- ° City of Roseville
- ° City of Santa Clara (doing business as Silicon Valley Power, SVP)

Each electric utility whose peak load in 2005 was 200 megawatts or greater was required to submit a forecast of its financial variables and its electricity sales, according to forms and instructions adopted by the Energy Commission.

From the submitted data, staff calculated future prices by dividing an estimate of annual revenue from each customer class by an estimate of annual electricity sales to that class. Staff calculated system-average prices by dividing each utility's total annual revenue projection by its total annual electricity sales projection for that year. Because the data the IOUs provided was fairly complete, staff's role in preparing the IOU forecasts was limited to checking data for reasonableness and making a simple calculation. If POU-submitted data was incomplete, the staff and technical assistance consultants completed POU forecasts by collecting additional data (for example, capital improvement budgets) for the missing years to determine total annual

revenue requirements for each year. When appropriate, POUs' annual reported revenue was increased to ensure that the POUs' net revenue requirements would be met.

Statewide, average retail prices are projected to increase at an annual growth rate of 1.8 percent in nominal terms, but to decrease by 0.3 percent in inflation-adjusted real dollars between 2005 and 2016. (The statewide price forecast does not extend to 2018, because PG&E did not provide data for 2017 and 2018.) By 2016, the California system-wide average retail electricity price is expected to be approximately 14.7 cents per kWh in nominal terms, or 11.6 cents in real terms. The system average price was 12 cents per kWh in 2005.

California's three largest investor-owned utilities are expected to have system-average retail prices in the range of 15 to 18 cents per kWh (in nominal terms) in 2018. California's 13 publicly owned utilities will likely have a wider range of system-average prices in 2018, between 9.4 cents and 18.6 cents per kWh in nominal terms.

California's statewide-average retail prices for electricity were higher in 2005 than those in any other western state. Factors contributing to Calfornia's relatively high retail electricity prices include its use of natural gas as a primary fuel source for electricity generation and its higher costs of serving large metropolitan areas.

The Energy Commission staff estimates for system-average retail electricity prices for investorowned and publicly owned utilities as follows:

- Los Angeles Department of Water and Power's system average retail electricity prices will increase from \$0.092 to \$0.131 per kWh between 2005 and 2018. This 42.4 percent increase in nominal terms translates into a 7.6 percent increase in real terms. The annual growth rate is 2.8 percent, nominally. In real terms, staff expects system-average retail prices to increase less than 1 percent (0.6 percent) annually.
- In 2005, SMUD's system average retail price was \$0.098 per kWh. The Energy Commission staff is forecasting that this average price will increase by 22.8 percent in 2018, to \$0.123 per kWh in nominal terms.
- Anaheim's system-average retail electricity price may increase from \$0.095 to \$0.128 per kWh between 2005 and 2018, in nominal dollars. This 34.7 percent increase in nominal terms translates into a 2.1 percent increase in real terms.
- Burbank's system-average retail electricity price may increase from \$0.125 to \$0.162 per kWh between 2005 and 2018 in nominal dollars. The annual growth rate is 2 percent, nominally.
- Glendale's system-average retail electricity price may increase from \$0.126 to \$0.186 per kWh between 2005 and 2018 in nominal dollars. This price is higher than the statewide average price.
- Pasadena's system-average retail electricity price may increase from \$0.107 to \$0.145 per kWh between 2005 and 2018 in nominal dollars. This 35.5 percent increase in nominal terms translates into a 1.9 percent increase in real terms.
- Redding's system-average retail electricity price may increase from \$0.093 to \$0.139 per kWh between 2005 and 2018. This 49.5 percent increase in nominal terms translates into an 11.8 percent increase in real terms.

- Riverside's system-average retail electricity price may increase from \$0.105 to \$0.137 per kWh between 2005 and 2018 in nominal terms. This 30.5 percent increase in nominal terms translates into a 1.0 percent decrease in real terms.
- Roseville's system-average retail electricity price may increase from \$0.082 to \$0.100 per kWh between 2005 and 2018. This 22.0 percent increase in nominal terms translates into an 8.5 percent decrease in real terms.
- Silicon Valley Power's system-average retail electricity price may increase from \$0.077 to \$0.094 per kWh between 2005 and 2018, far below the statewide average price.
- Imperial Irrigation District's system-average retail electricity price may increase from \$0.103 to \$0.148 per kWh between 2005 and 2018 in nominal dollars. This 43.7 percent increase in nominal terms translates into an 8.7 percent increase in real terms.
- Modesto Irrigation District's system-average retail electricity price may increase from \$0.090 to \$0.136 per kWh between 2005 and 2018. This 51.1 percent increase in nominal terms translates into a 14.4 percent increase in real terms.
- Turlock Irrigation District's system-average retail electricity price may increase from \$0.085 to \$0.124 per kWh between 2005 and 2018. The annual growth rate is 2.9 percent, nominally. In real terms, staff expects system average retail prices to increase less than 1 percent (0.8 percent) annually.

In the recent past, natural gas prices have been the most volatile contributor to higher retail electric prices in California. An increase in natural gas prices, however, will not cause an equivalent increase in retail electric prices, because natural gas is just one cost component of retail prices. During the forecast period, staff expects natural gas prices to remain an important component of retail electric prices, although hedging can be an effective means of shielding the utility from an increase in natural gas prices. Hedging, however, does not protect a utility against a sustained multi-year increase in natural gas prices, such as that experienced from 1997 to 2006.

CHAPTER 1: INTRODUCTION

This report compiles preliminary forecasts of retail electricity prices for the years 2007 through 2018. These forecasts are based on financial and sales projections requested from California's 16 largest electric utilities. The report presents forecasts of average retail prices for five classes of electric utility customers: residential, commercial, industrial, agricultural, and other. The staff of the California Energy Commission (Energy Commission) Electricity Analysis Office will discuss these preliminary forecasts at the July 2, 2007 workshop of the Integrated Energy Policy Report Committee. After the workshop, the staff may revise this report by incorporating suggested changes received from the utilities, ratepayer groups, the public, and other market participants.

This chapter provides background information about the purpose and scope of the retail price forecasts and the methodology employed to prepare them. It also provides a summary of the key findings regarding these forecasts.

The state law mandating the *Integrated Energy Policy Report (IEPR)*, Senate Bill 1389 (Bowen), Chapter 568, Statutes of 2002, requires the Energy Commission to conduct an "assessment of…the outlook for…retail prices…for electricity…under current market structures and expected market conditions."¹

To perform this forecast, the Energy Commission is authorized to "require submission of demand forecasts, resource plans, market assessments, and related outlooks from electric...utilities...and other market participants." Furthermore, the Energy Commission's regulations require "each electric...utility to submit, according to forms and instructions adopted by the Commission, a forecast of energy prices which corresponds to the utility's demand forecast and resource plan. Each electric utility shall also submit a forecast of utility financial variables consistent with the forecast and plan" (emphasis added).³

The Energy Commission determined which utilities would have to submit their retail electricity price forecasts by identifying those with a peak electrical demand in 2005 of 200 megawatts or greater. The participating utilities were:

• Investor-Owned Utilities

- ° Pacific Gas and Electric (PG&E)
- Southern California Edison (SCE)
- ° San Diego Gas and Electric (SDG&E)

• Publicly Owned Utilities (POUs)

° Sacramento Municipal Utility District (SMUD)

Forecast and Assessment of Energy Loads and Resources, Section 1348. Pricing and Financial Information, *Energy Commission's Regulations*, Publication No. CEC-140-2006-001, http://www.energy.ca.gov/2006publications/CEC-140-2006-001/CEC-140-2006-001.PDF.

- Los Angeles Department of Water and Power (LADWP)
- ° Imperial Irrigation District (IID)
- Modesto Irrigation District (MID)
- ° Turlock Irrigation District (TID)
- ° City of Anaheim
- ° City of Burbank
- ° City of Glendale
- ° City of Pasadena
- ° City of Redding
- ° City of Riverside
- ° City of Roseville
- ° City of Santa Clara (doing business as Silicon Valley Power, SVP)

The State of California uses retail electricity price forecasts in the following ways:

- As an explanatory variable in the Energy Commission's electricity demand forecast.
 - The demand-forecasting model assumes that consumers will reduce their electricity use when retail electricity prices increase and vice versa. Since the demand forecast is used in part to authorize investor-owned utilities (IOUs) to procure new power supplies, future retail electricity rates are an important consideration when planning for California's electricity system.
- As a metric for calculating the cost-effectiveness of proposed changes to the California Title 24 Buildings and Appliance Energy Efficiency Standards.

The staff welcomes feedback from the public and market participants about how it has used or intends to use these retail electricity price forecasts.

Table 1, below, shows the 2005 statistics for the California electric utilities whose peak load exceeded 200 MW. The utilities are listed in order by number of customers. The state's five largest utilities — three IOUs and 2 POUs — serve 92 percent of California's electricity customers and represent the largest concentration of revenue collections and electricity sales. Although PG&E has the largest number of customers, SCE has the larger revenues, sales, and peak load.

Source: U.S. Energy Information Administration (EIA) and California Energy Commission

The forecasts of retail electricity prices are expressed in average dollars per kilowatt-hour (kWh) for each class of retail customer. They were calculated by dividing an estimate of annual revenue from each customer class by an estimate of annual electricity sales to that class. System-average prices were calculated by dividing each utility's total annual revenue projection by its total annual electricity sales projection for that year. The staff used the deflator series to convert the forecasted prices from nominal to real dollars (\$2005). This deflator series reflects an assumption that inflation will increase by 2.2 percent annually between 2005 and 2018.

In addition to this introduction, the draft report is organized into five chapters:

- Statewide Results
- Investor-Owned Utility Results
- Publicly Owned Utilities
- Electricity Price Sensitivity to Natural Gas Prices

Appendix A provides the deflator series that staff used to convert nominal dollars to real dollars (\$2005). Appendix B provides a table for each utility's retail price forecasts. Appendix C provides graphs of the system-average and customer-class forecasts for publicly owned utilities other than LADWP and SMUD.

Background

These retail price forecasts indicate by how much retail electricity prices are likely to change over the next 10 years, but they should not be used for calculating the economic payback of site-specific energy-efficiency and distributed generation projects (for example, lighting or heating,

ventilation, and air conditioning [HVAC] equipment replacements). Analysts should use the utility's current rate schedule to analyze the cost-effectiveness of specific projects.

These forecasts are not utility *rate* forecasts, because there are too many rate schedules and many of these rate schedules are complex. For example:

- Each utility has multiple rate schedules for each customer class. For example, one residential customer may be on a utility's standard rate schedule for residential customers, while another family may be on a residential time-of-use rate schedule.
- Each rate schedule has multiple charges, some of which are based on how much electricity was used during the billing period (the "energy charge") and some of which are based on other factors. For example, SCE's monthly "basic charge" for residential customers is determined by the number of days in the billing period. Medium- and large-sized business customers pay a "demand charge" (in dollars per kilowatt) for the maximum amount of electricity used during any 15-minute period of the billing cycle.
- The "energy charge" within a rate schedule varies by season (summer and winter) and may also vary by time of day. Furthermore, IOUs' and some POUs' residential rate schedules are designed to charge higher rates for each tier of electricity consumption above baseline quantities.

While the Energy Commission does not forecast individual tariffs, it does review electric utility tariffs for consistency with the *Energy Action Plan* goals and other objectives expressed in prior *IEPRs*.

Methodology

The staff developed two sets of forms and instructions for collecting the financial and sales data needed to calculate average retail prices: one set for IOUs and one for publicly owned utilities (POUs).^{4,5} The staff learned that the POUs' Form 1.a should have also requested information on each utility's other sources of income (for example, sales of surplus power and natural gas, transmission revenue, and interest income) to obtain *net* total annual revenue requirements. The *net* reveue requirements are those that the utility must recover from its customers through rates.

⁴ Forms and Instructions for Investor-Owned Utilities & Energy Service Providers Submitting Retail Electricity Price Data, Commission Report, February 2007, CEC-200-2006,003-CMF, http://www.energy.ca.gov/2006publications/CEC-200-2006-003/CEC-200-2006-003-CMF_IOU.xls, and http://www.energy.ca.gov/2006publications/CEC-200-2006-003/CEC-200-2006-003-CMF_IOU.xls, and http://www.energy.ca.gov/2006publications/CEC-200-2006-003/CEC-200-2006-003-CMF_IOU.xls, and http://www.energy.ca.gov/2006publications/CEC-200-2006-003/CEC-200-2006-003-CMF_IOU.xls, and http://www.energy.ca.gov/2006publications/CEC-200-2006-003/CEC-200-2006-003-CMF_ESP.xls

⁵ Forms and Instructions for Publicly-Owned Utilities Submitting Retail Electricity Price Data, Commission Report, March 2007, CEC-200-2007-002-CMF, http://www.energy.ca.gov/2007publications/CEC-200-2007-002/CEC-200-2007-002-CMF.PDF and http://www.energy.ca.gov/2007publications/CEC-200-2007-002/CEC-200-2007-002-CMF_POU_Forms.xls.

The staff intends to solicit additional feedback from the POUs and modify these forms further before issuing them again during the 2009 forecasting cycle.

The data provided by the IOUs was fairly complete, so the staff's role in preparing the IOU forecasts was limited to check data for reasonableness.

The data provided by many POUs, however, was incomplete. For example, POUs did not project costs for all years of the 11-year forecast period. In such cases, the staff and technical assistance consultants completed these POUs' forecasts by collecting from them additional data for the years not completed (for example, capital improvement budgets and debt service schedules) to determine total annual revenue requirements for each year. When appropriate, POUs' annual reported revenue was increased to ensure that the POUs' net revenue requirements would be met. Many of these revised forecasts were sent back so that POU staff could conduct its own reasonableness review. For this reason, the POU forecasts are more independent than the IOU forecasts, because the staff did not change any of the IOU-submitted data.

CHAPTER 2: STATEWIDE RESULTS

Statewide results, as shown in Figure 1, are weighted-average prices calculated from the retail electricity price forecasts of three IOUs and 13 POUs. In 2005, for example, total revenues from electricity sales by these utilities were approximately \$26 billion, and total electricity sales were approximately 216 billion kilowatt-hours, for an average price of 12 cents per kWh.

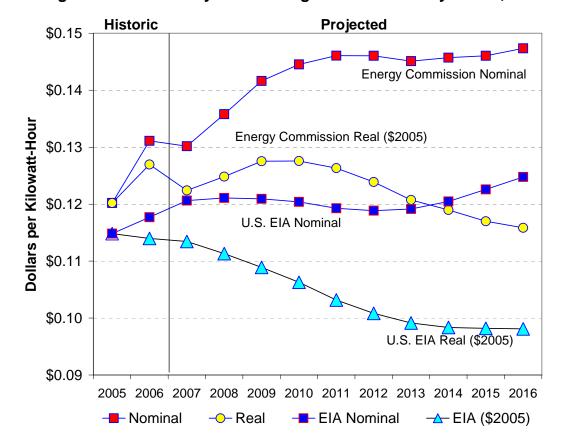

Figure 1: California System-Average Retail Electricity Prices, 2005 to 2016

Sources: California Energy Commission and U.S. Energy Information Administration

California's statewide-average retail prices for electricity⁶ were higher in 2005 than those in any other western state, as shown in Table 2. California's prices were more than 20 percent higher than Nevada's prices for all classes of electricity consumer. Arizona's prices were between 40 and 60 percent lower than California's prices, depending on the customer class. Oregon's prices for industrial customers were nearly half those paid on average by California's industrial sector. California's residential prices were twice as much as prices in Idaho, the western state with the lowest retail electricity prices in all sectors.

9

⁶ The system-average price of 11.63 cents per kWh for California in Table 2 from the U.S. Energy Information Administration (EIA) differs from the 12.1 cents per kWh calculated for California by the Energy Commission staff and shown in Figure 1. The probable reason is that EIA uses different weights in its calculation.

Table 2: Retail Price Comparisons: California and Other Western States

| Average Retail Prices in 2005 (cents per kilowatt-hour) | | | | | | |
|---|-------------|------------|------------|-------------|--|--|
| | Residential | Commercial | Industrial | All Sectors | | |
| Arizona | 8.86 | 7.40 | 5.85 | 7.79 | | |
| California | 12.51 | 11.92 | 9.55 | 11.63 | | |
| Colorado | 9.06 | 7.62 | 5.74 | 7.64 | | |
| Idaho | 6.29 | 5.42 | 3.91 | 5.12 | | |
| Montana | 8.10 | 7.43 | 4.83 | 6.72 | | |
| Nevada | 10.20 | 9.48 | 7.71 | 9.02 | | |
| New Mexico | 9.13 | 7.81 | 5.61 | 7.51 | | |

| US Average | 9.45 | 8.67 | 5.73 | 8.14 | | |

Source: U.S. Energy Information Administration

Only California and Nevada use natural gas as their primary fuel source for electricity generation. The other western states use lower-cost sources, either hydroelectricity or coal.⁷ California's high average retail electricity prices are due in part to the higher costs of serving large metropolitan areas (such as higher labor costs, franchise fees, and property taxes and additional costs for undergrounding electric distribution facilities).⁸

⁷ See each state's profile at *State Electricity Profiles*, http://www.eia.doe.gov/cneaf/electricity/st_profiles/e_profiles_sum.html.

^{8 &}quot;Big City Bias: The Problem with Simple Rate Comparisons," by Johannes P. Pfeifenberger and Mark W. Jenkins, *Public Utilities Fortnightly*, December 2002, http://www.pur.com/pubs/4057.cfm

CHAPTER 3: INVESTOR-OWNED UTILITY RESULTS

California's three largest IOUs serve approximately 75 percent of the state's retail electricity loads. In 2005, they collected more than \$20 billion in revenue from both bundled and unbundled (direct access) retail customers.

The IOUs' retail electricity rates are regulated by the California Public Utilities Commission (CPUC). Every year, IOUs apply to the CPUC to adjust how much revenue they are authorized to collect through multiple "revenue requirement," "cost of capital," "general rate case," "Energy Resource Recovery Account (ERRA)," and other proceedings. General rate cases are conducted in two phases: first, to establish the revenue requirements, then to allocate those revenue requirements among each customer class or between bundled and unbundled customers. The ERRA proceeding provides an annual opportunity to ensure timely recovery of an electric utility's power-purchase expenses. The cost-of-capital proceedings determine the appropriate "rate of return" percentages for the utility's rate base. Other "revenue requirement" proceedings cover single-topic cost-recovery issues, such as spending for energy efficiency programs or nuclear decommissioning. Details of CPUC ratemaking decisions are implemented by the IOUs through advice letters. Once these advice letters are approved by CPUC staff, proposed changes to individual rate tarrif sheets become official. Because there can be multiple rate-related proceedings each year, tariff sheets (rate schedules) can change more than once in a year.

Costs associated with electric industry restructuring and with the energy crisis are still included in today's IOU rates, but during this forecast period many of these costs will sunset. For example, the rate reduction bonds, which were financed by residential and small commercial customers (the beneficiaries of those rate reductions) will mature in December 2007. The Fixed Transition Amount (PG&E) or Trust Transfer Account (SCE and SDG&E) line item on residential and small-commercial bills will disappear. PG&E's Energy Recovery Bonds, issued to recover costs associated with its bankruptcy, will mature in December 2012. The last of the Department of Water Resources (DWR) power-supply contracts, which were allocated to PG&E, SCE, and SDG&E, will all expire during the 2007-2018 forecast period. Costs associated with electric industry restructuring or the energy crisis will continue beyond 2018, including the following: payments to the California Independent System Operator for on-going market and transmission-related charges, Public Purpose Program charges, DWR bond charges, and the On-Going Competitive Transition Charge.

11

⁹ The transmission component of IOUs' retail rates are regulated by the Federal Energy Regulatory Commission. Revenue requirements to pay for DWR power supply and DWR bond charges are determined by the California DWR and passed through to IOU ratepayers, without modification, by the CPUC.

Pacific Gas and Electric

PG&E submitted four versions of its cost and sales data in response to the Energy Commission's request for retail price-related data. In this report, the staff provides forecast results only for PG&E's "Scenario 2: Current World, Low Preferred Resources Availability." In this scenario, assumptions about future natural gas prices and demand growth are in the "middle" of its other three scenarios.

Portions of PG&E's data were granted a confidential designation, including its electricity sales projections for 2008 and 2009. To prevent this data from being disclosed, the detailed retail price forecasts provided in Appendix B omit the findings for 2008 and 2009. The values were used, however, in Figure 2.¹⁰

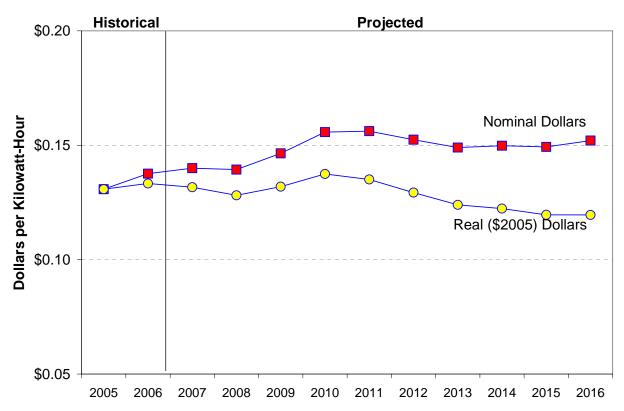

Figure 2: PG&E's System Average Retail Electricity Prices, 2005 to 2016

Source: California Energy Commission

PG&E's system-average retail electricity prices were \$0.121 in 2005 and increase to \$0.148 in 2016. The change in price is a 22 percent increase, nominally. In real terms, however, the system average price will decrease to \$0.116 in 2016.

12

¹⁰ These prices were included in the graph per an agreement with PG&E.

Figure 3 illustrates the projected prices per kWh for PG&E's bundled customers by customer class. Note that commercial retail prices were higher than residential prices in 2005, but they are forecasted to be lower than residential retail prices starting in 2007.

0.20 Nominal Real - Residential - Commercial - Agricultural - Industrial - Residential - Residential

Figure 3: PG&E's Retail Price Forecasts by Customer Class, 2005 to 2018

Source: California Energy Commission

Fixed-Asset Value and Cost Trends

As shown in Table 3, the value of PG&E's power plants and transmission and distribution system was more than \$29 billion in 2006. PG&E's distribution system represents more than half of this value and includes its substations, poles, wires, and meters. Since the 2001-2002 energy crisis, the value of PG&E's infrastructure has increased 10 percent overall, despite a 2 percent drop in value for utility-owned generating facilities. The largest percentage gain in value between 2003 and 2006 was from PG&E's transmission system, which increased in value by more than 30 percent. The value of PG&E's distribution system increased more than 14 percent.

Table 3: Value of PG&E's Electric Facilities in Service 2003 to 2006 (dollars)

| | 2003 | 2004 | 2005 | 2006 |
|---------------------------------|------------------|------------------|------------------|------------------|
| PRODUCTION PLANT | 9,030,898,950 | 9,141,493,171 | 9,234,382,343 | 8,831,393,375 |

Source: Federal Energy Regulatory Commission (FERC)

PG&E's total operation and maintenance (O&M) expenses in 2006 were more than \$5.4 billion, as shown in Table 4, below. These expenses have increased by more than 21 percent since 2003.

Table 4: PG&E's Total Electric Operations and Maintenance Expenses, 2003 to 2006 (dollars)

| | 2003 | 2004 | 2005 | 2006 |

| TOTAL ELECTRIC O&M EXPENSES | 4,454,527,954 | 4,857,668,351 | 4,545,107,664 | 5,400,191,977 |

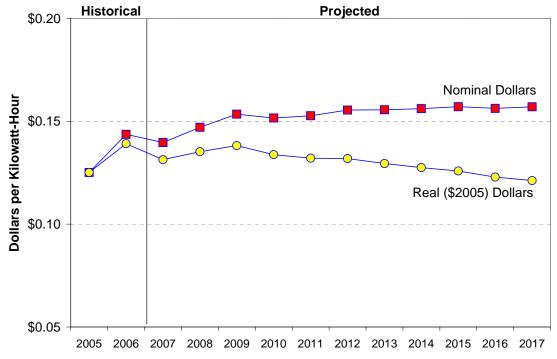

Source: Federal Energy Regulatory Commission

Purchasing and producing electricity (that is, power production expenses) is the largest share of annual expenses, approximately 62 percent in each year. Purchased power expenses, alone, comprised more than 48 percent of total annual O&M expenses in 2006. Since 2003, purchased power expenses have grown at a rate of approximately 3.5 percent per year. Annual power purchases and the prices paid for those purchases differ due to a number of factors, such as higher than expected electricity demand (as occurred during the July 2006 "heat storm"), a decline in the volume of electricity provided through expiring DWR contracts, availability of PG&E's Diablo Canyon nuclear power plant, water supply availability for hydroelectric generation, and migration of direct-access customers back to PG&E service.

Southern California Edison

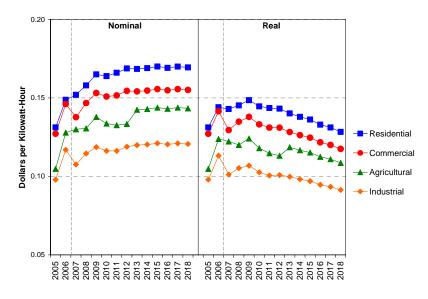

SCE's system-average retail electricity prices are projected to increase nominally by more than 25 percent between 2005 and 2018, from \$0.125 to \$0.157. In real terms, however, prices are projected to drop to \$0.119 in 2018, a 4.8 percent decrease, as illustrated in Figure 4.

Figure 4: SCE's System Average Retail Electricity Prices, 2005 to 2018

Source: California Energy Commission

Figure 5: SCE's Retail Price Forecasts by Customer Class, 2005 to 2018

Source: California Energy Commission

As shown in Figure 5, SCE is expecting the CPUC to approve a shifting in costs from commercial and industrial customers to residential customers in 2007.

Fixed-Asset Value and Cost Expenses

The value of SCE's electric system in 2006 was more than \$25 billion, as shown in Table 5. SCE's distribution system represents 45 percent of this total value. The San Onofre nuclear power plant represents approximately 79 percent of the total value in utility-owned electricity generating facilities. Additions and improvements to SCE's transmission system resulted in the steady, 7 percent annual growth rate in value for this asset between 2003 and 2006.

Table 5: Value of SCE's Electric Facilities in Service, 2003 to 2006 (dollars)

| | 2003 | 2004 | 2005 | 2006 |

Source: Federal Energy Regulatory Commission

SCE's annual O&M expenses have been increasing since 2003 by a 12.6 percent annual growth rate. Power-related costs represented more than 70 percent of total O&M expenses in 2006, of which purchased power was the largest cost factor, as shown in Table 6, below.

Table 6: SCE's Total Electric Operations and Maintenance Expenses, 2003 to 2006 (dollars)

Source: Federal Energy Regulatory Commission

San Diego Gas and Electric

SDG&E has, and is forecasted to have, the highest retail electricity rates among the three largest IOUs in the state. Based on its submitted cost and sales data, SDG&E expects its system-average retail prices to increase from \$0.145 to \$0.178 per kWh between 2005 and 2018, as shown in Figure 5. In real terms, however, system average prices decrease approximately seven percent between 2005 and 2018, to \$0.135 per kWh.

\$0.20 | Historical | Projected | Nominal Dollars | Nominal Dollars

Figure 6: SDG&E's System Average Retail Electricity Prices, 2005 to 2018

Source: California Energy Commission

In Figure 7, forecasts of average retail prices are shown for three customer classes. Note that prices for commercial and industrial customers are reported together, in part because SDG&E has a small number of industrial customers. Note also that SDG&E expects the CPUC to approve a shift in cost allocation from the commercial and industrial class to the residential customer class. Appendix B provides the price details by customer class for the forecast period, except for 2006 through 2009. These prices were not included because SDG&E's electricity sales data was granted a confidential designation for those years.

Figure 7: SDG&E's Retail Price Forecasts by Customer Class, 2005 to 2018

Source: California Energy Commission

Fixed-Asset Value and Cost Expenses

SDG&E's electrical system was worth more than \$6.7 billion in 2006, as shown in Table 7. Its distribution system represented more than half of this value. SDG&E's fixed assets increased by more than 27 percent between 2003 and 2006, primarily due to additions in steam and "other" power plant assets. Specifically, SDG&E's power plant assets include an ownership share in the San Onofre nuclear power plant and the natural gas-fired Palomar power plant (555 megawatts), which began operation in 2006.

Table 7: Value of SDG&E's Electric Facilities in Service, 2003 to 2006 (dollars)

| | 2003 | 2004 | 2005 | 2006 |

Source: Federal Energy Regulatory Commission

Table 8 shows that SDG&E's O&M costs increased by 35 percent between 2003 and 2006. The largest percentage increases occurred in the customer service and information, transmission, and power production expense cost categories.

Table 8: SDG&E's Total Electric Operations and Maintenance Expenses, 2003 to 2006 (dollars)

CHAPTER 4: PUBLICLY OWNED UTILITIES

The Los Angeles Department of Water and Power (LADWP) and the Sacramento Municipal Utility District (SMUD) are the state's two largest publicly owned utilities. Together, LADWP and SMUD have 81 percent more customers, 32 percent more sales revenues, and 30 percent more electricity sales than all of the other publicly owned utilities in the state combined.

Los Angeles Department of Water and Power

In 2005, LADWP had 1.4 million customers, annual sales revenues of more than \$2.2 billion, and electricity sales of 23.4 million megawatt-hours (MWh).

In June, 2007, the LADWP's oversight board proposed raising base electricity rates for the first time since 1992. Part Rates would increase by 9 percent overall, but would be phased in over three years. The additional revenues collected through this rate increase would be used to fund distribution infrastructure improvements, energy efficiency programs, renewable energy, Port of Los Angeles electrification, and other projects. LADWP is also a leader among other publicly owned utilities in deploying advanced meters.

The Energy Commission staff estimates that LADWP's system average retail electricity prices will increase from \$0.092 to \$0.131 per kWh between 2005 and 2018, as illustrated in Figure 8. This 42.4 percent increase in nominal terms translates into a 7.6 percent increase in real terms. The annual growth rate is 2.8 percent, nominally. In real terms, the staff expects system-average retail prices to increase less than 1 percent (0.6 percent) annually.

Figure 9 provides the projections of average retail prices per customer class: residential, commercial, and industrial. The forecast assumes that LADWP will maintain its current revenue allocations per customer class after 2007 (no major shifts in revenue collections from one class to another).

Appendix B provides the dollar values for these customer-class forecasts.

Modifications to LADWP's Submitted Data

Staff used the cost data provided by the LADWP on its Form 1.a to determine total annual revenue requirements, with the following exceptions:

- Capital improvement costs were updated to reflect LADWP's new plan through fiscal year 2011-12. Beginning in fiscal year 2012-13, capital improvement costs were escalated at 5 percent per year, based on projected averages.
- Capital improvement costs were assumed to be financed with cash (20 percent) and bonds (80 percent). The additional financing costs for debt service were added to annual revenue requirements.
- The transfer to the General Fund was adjusted so that it equaled 7 percent of revenue.
- Non-retail revenue was provided by LADWP for the forecast period and used to reduce the amount of revenue that must be recovered from retail customers.

Annual sales revenue data provided by LADWP in its Form 1.b had an annual increase of 34 percent from 2006 to 2007. Revenue for 2007 through 2011 was adjusted to reflect the forecasted revenue in LADWP's Power System Financial Projections. Beginning in 2012, revenue was increased by sales growth plus forecasted rate increases to be able to pay for the additional revenue requirements. The rate increases resulted in an annual revenue growth rate of 3.1 percent from 2007 to 2018.

LADWP provided the electricity sales forecast on Form 1.c. The rate of growth of this forecast was 0.7 percent per year from 2007 to 2018. Energy Commission staff used the data provided by LADWP in this form in its retail price calculation.

Sacramento Municipal Utility District

The Sacramento Municipal Utility District, SMUD, has approximately 600,000 retail customers, compared to LADWP's 1.4 million customer count, and its annual sales revenue and electricity sales are approximately half those of LADWP.

In 2005, SMUD's system average retail price was \$0.098 per kWh. The Energy Commission staff is forecasting that this average price will increase by 22.8 percent in 2018, to \$0.123 per kWh in nominal terms, as shown on Figure 10. Figure 11 shows the customer-class forecasts for SMUD.

Source: California Energy Commission

Modifications to SMUD's Submitted Data

All historical and projected cost information provided by SMUD (Form 1.a) was used except for the following adjustments:

- Increased amounts for energy efficiency programs by using SMUD-provided updates to its spending plan for these programs.
- Updated the existing debt service schedule to reflect SMUD's two, latest borrowings.
- Assumed capital improvement costs were to be financed with cash (20 percent) and bonds (80 percent). SMUD-reported capital improvement costs include generation, transmission, distribution, and advanced metering investments.
- Projected revenues from other sources of income (such as sales of surplus electricity and natural gas) between 2007 and 2018, based on SMUD-provided historical data regarding its non-retail revenues through 2006.

In Form 1.b, SMUD assumed its sales revenues would increase by only 2.03 percent annually. SMUD's sales revenue income was increased by 7 percent in 2008 to reflect the SMUD Board's recent approval of an across-the-board rate increase. Then, beginning in 2009, annual sales revenues were increased by the same growth rate as SMUD's average annual growth rate for electricity sales (kWh), 2.02 percent. When total net revenue requirements appeared to exceed forecasted revenue, a rate increase was forecasted. The resulting average annual growth rate in sales revenues became 4.04 percent.

Other Publicly Owned Utilities

Similar to Figures 10 and 11 for SMUD, staff provided a system-average and a class-average graph for each utility. These graphs are located in Appendix C. This chapter provides short descriptions of the forecast results for the other publicly owned utilities.

City of Anaheim – Anaheim's system-average retail electricity price may increase from \$0.095 to \$0.128 per kWh between 2005 and 2018. This 34.7 percent increase in nominal terms translates into a 2.1 percent increase in real terms. The annual growth rate is 2.3 percent, nominally. In real terms, the staff expects system average retail prices to increase less than 1 percent (0.2 percent) annually.

City of Burbank – Burbank's system-average retail electricity price may increase from \$0.125 to \$0.162 per kWh between 2005 and 2018. This 29.6 percent increase in nominal terms translates into a 1.6 percent decrease in real terms. The annual growth rate is 2.0 percent, nominally. In real terms, staff expects system average retail prices to decrease less than 1 percent (0.1 percent) annually.

City of Glendale – Glendale's system-average retail electricity price may increase from \$0.126 to \$0.186 per kWh between 2005 and 2018. This 47.6 percent increase in nominal terms translates into an 11.9 percent increase in real terms. The annual growth rate is 3.0 percent, nominally. In real terms, staff expects system average retail prices to increase less than 1 percent (0.9 percent) annually.

City of Pasadena — Pasadena's system-average retail electricity price may increase from \$0.107 to \$0.145 per kWh between 2005 and 2018. This 35.5 percent increase in nominal terms translates into a 1.9 percent increase in real terms. The annual growth rate is 2.4 percent, nominally. In real terms, staff expects system average retail prices to increase less than 1 percent (0.1 percent) annually.

City of Redding – Redding's system-average retail electricity price may increase from \$0.093 to \$0.139 per kWh between 2005 and 2018. This 49.5 percent increase in nominal terms translates into an 11.8 percent increase in real terms. The annual growth rate is 3.1 percent, nominally. In real terms, staff expects system average retail prices to increase less than 1 percent (0.9 percent) annually.

City of Riverside – Riverside's system-average retail electricity price may increase from \$0.105 to \$0.137 per kWh between 2005 and 2018. This 30.5 percent increase in nominal terms translates into a 1.0 percent decrease in real terms. The annual growth rate is 2.1 percent, nominally. In real terms, staff expects system average retail prices to decrease less than 1 percent (0.1 percent) annually.

City of Roseville – Roseville's system-average retail electricity price may increase from \$0.082 to \$0.100 per kWh between 2005 and 2018. This 22.0 percent increase in nominal terms translates into an 8.5 percent decrease in real terms. The annual growth rate is 1.5 percent, nominally. In real terms, staff expects system average retail prices to decrease less than 1 percent (0.7 percent) annually.

City of Santa Clara (doing business as Silicon Valley Power) — Santa Clara's system-average retail electricity price may increase from \$0.077 to \$0.094 per kWh between 2005 and 2018. This 22.1 percent increase in nominal terms translates into a 7.8 percent decrease in real terms. The annual growth rate is 1.5 percent, nominally. In real terms, staff expects system average retail prices to decrease less than 1 percent (0.6 percent) annually.

Imperial Irrigation District – Imperial Irrigation District's system-average retail electricity price may increase from \$0.103 to \$0.148 per kWh between 2005 and 2018. This 43.7 percent increase in nominal terms translates into an 8.7 percent increase in real terms. The annual growth rate is 2.8 percent, nominally. In real terms, staff expects system average retail prices to increase less than 1 percent (0.6 percent) annually.

Modesto Irrigation District – Modesto Irrigation District's system-average retail electricity price may increase from \$0.090 to \$0.136 per kWh between 2005 and 2018. This 51.1 percent increase in nominal terms translates into a 14.4 percent increase in real terms. The annual growth rate is 3.2 percent, nominally. In real terms, staff expects system average retail prices to increase 1 percent (1.0 percent) annually.

Turlock Irrigation District – Turlock Irrigation District's system- average retail electricity price may increase from \$0.085 to \$0.124 per kWh between 2005 and 2018. This 45.9 percent increase in nominal terms translates into a 10.6 percent increase in real terms. The annual growth rate is 2.9 percent, nominally. In real terms, staff expects system average retail prices to increase less than 1 percent (0.8 percent) annually.

CHAPTER 5: ELECTRICITY PRICE SENSITIVITY TO NATURAL GAS PRICES

The most volatile component of retail electric rates is the cost of natural gas. Table 9 shows the U.S. Energy Information Administration (EIA) record of average annual natural gas prices sold to electric power consumers in California over the last 10 years. With the exception of 1998 and 1999, the percent change in natural gas prices paid by California utilities has fluctuated in double digits on a percentage basis in each of the last 10 years.

Table 9: Average Natural Gas Prices Paid by Electric Generators in California

| Year | Price \$/mcf | Percent Change |
|------|-----------------|-------------------|
| 1997 | 3.08 | |
| 1998 | 2.79 | -9.4 |
| 1999 | 2.76 | -1.1 |
| 2000 | 5.88 | 113.0 |
| 2001 | 9.38 | 59.5 |
| 2002 | 3.82 | -59.3 |
| 2003 | 5.50 | 44.0 |
| 2004 | 6.05 | 10.0 |
| 2005 | 8.08 | 33.6 |
| 2006 | 6.68 | -17.3 |

The range in changes in natural gas prices paid by California utilities has been from minus 59.3 percent in 2002 to plus 113.0 percent in 2000. The overall trend has been for natural gas prices to increase over the 10-year period, with the price of natural gas in 2006 over twice the level experienced in 1997.

Natural gas prices have been volatile, wide ranging, and a contributor to higher retail electric prices in California. Table 10 shows the U.S. EIA's record of average retail electric prices in California.

Table 10: Average Retail Electric Prices in California

| Year | Price \$/kWh | Percent Change |
|------|-----------------|-------------------|
| 1997 | .0954 | |
| 1998 | .0903 | -5.3 |
| 1999 | .0875 | -3.1 |
| 2000 | .0947 | 8.2 |
| 2001 | .1122 | 18.5 |
| 2002 | .1219 | 8.6 |
| 2003 | .1178 | -3.4 |
| 2004 | .1135 | -3.7 |
| 2005 | .1163 | 2.5 |

Source: U.S. Energy Information Administration

A comparison of Table 9 to Table 10 shows that while the price California electric utilities paid for natural gas increased 162 percent between 1997 and 2005, the average retail rate in California increased 21.9 percent during the same time period. The reason for the disparity is that natural gas is just one component of many that make up retail electric rates.

Retail electricity prices are basically total revenues divided by total sales. Total revenues are built from the various cost components such as customer, distribution, transmission, and generation costs. Some of these costs on a per kWh basis may actually decline or not change from a given year to the next due to infill, productivity increases, technological improvements, and demand increases.

During the forecast period, it appears that natural gas prices will still be an important component of retail electric rates. As in the past, however, natural gas prices and retail electric prices will not have a one-to-one correlation.

Natural gas prices are forecast by both the EIA and consulting firms. EIA publishes its forecast annually, while the forecasts of the consulting firms appear sporadically. The forecasts of the consultants are to varying degrees proprietary, but enough details are made public to infer the overall outlook of the consultants.

Figure 12 shows the EIA forecast of average United States prices for natural gas used in power generation. Although natural gas prices in California will differ somewhat from the national average, the purpose of presenting this figure is not for the prices themselves but for the trend that they illustrate.

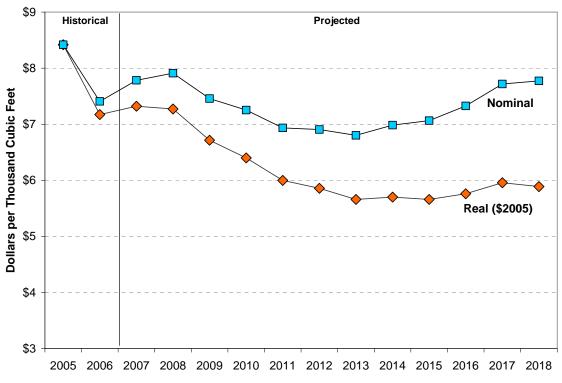

Figure 12: Average U.S. Prices for Natural Gas as a Power Plant Fuel

Source: U.S. Energy Information Administration

The basic premise behind the EIA natural gas price forecast (and all of the forecasts prepared by consulting firms) is that current natural gas prices are above the cost of production. EIA and all of the consulting firms believe that natural gas costs less to produce than current market prices. They all believe that this is due to temporary market forces and that competition will force natural gas prices to decrease toward the cost of production in a few years.

Every single electric utility that submitted a natural gas price forecast exhibits a similar philosophy. The utilities differ on the degree of the decrease, but they all agree that natural gas prices will decrease for the next few years. Staff is not aware of any international, national, or state government agency that has forecasted differently. Nor does staff know of any consulting firms that forecast differently.

The government consulting forecasting complex appears to be of one mind on this issue. It believes that there are sufficient reserves to satisfy current and future demand at costs much lower than prevailing natural gas prices. It believes that current prices are an aberration that will pass and be replaced by natural gas prices much closer to the cost of production.

What if natural gas prices are not about to decline? What if they are about to increase? To gauge the exposure of the five largest electric utilities to increases in natural gas prices, staff has calculated an estimate for each utility of its maximum exposure to increases in natural gas prices.

Table 11 illustrates the possible relationship between natural gas prices and retail electric rates for the five largest electric utilities in California. The table is derived by combining elements of

each utility's Power Content Label (annual resource mix) percentages with portions of the data submittals made by the utilities in response to the retail price forecast *Forms and Instructions*.

Table 11: Estimated Maximum Exposure to Natural Gas Costs as a Percentage of Total Annual Revenue Requirements

| Year | SCE | PG&E ₁₂ | LADWP | SDG&E | SMUD |
|------|-----|--------------------|-------|-------|------|
| 2007 | 30 | | 15 | 30 | 35 |

Source: California Energy Commission

As the table heading states, the table shows the estimated maximum natural gas cost exposure as a percentage of total revenue requirements. Therefore, the "30" in the column headed "SCE" and in the row labeled "2007" indicate that an estimated 30 percent of SCE's revenue requirements may be attributable to natural gas costs. If natural gas costs were to double in 2007 relative to SCE's natural gas price forecast, its total revenue requirement in 2007 would increase by another 30 percent.

Several cautions are in order when interpreting the data in Table 11. If rates were increased on this order of magnitude, demand may decrease. Natural gas usage by the electric utility would decrease in response to the decrease in demand. This would lower the exposure to the increase in natural gas prices.

29

¹² Staff could not estimate percentages for PG&E in 2007, 2008, 2017, or 2018, because data was unavailable.

Also note that a decrease in percentage exposure, such as from 30 percent in 2007 to 24 percent in 2012, may not mean that SCE projects a decrease in physical units of natural gas reliance. It may mean that SCE projects that natural gas prices will be lower in 2012 than in 2007. Or it may mean that they will displace natural gas with another source.

A second caution is warranted when comparing utilities. A lower percentage in the same year by one utility compared to another may reflect a lower reliance on physical natural gas, or it may reflect a lower projection of natural gas prices, or both.

Another caution involves steps taken by utilities, utility boards, and regulators to shield ratepayers from fluctuations in natural gas prices. The CPUC has authorized the investor-owned utilities to hedge natural gas prices. In any given year, SCE, PG&E, and SDG&E may only be minimally affected by increases in natural gas prices due to hedging.

Hedging allows the utility to buy futures or commitments to deliver natural gas at a fixed price months before the utility needs the natural gas. If natural gas prices increase, the value of the futures or commitment increases and offsets the increase in natural gas prices incurred by the utility. Or at least it does in theory. In practice, there may be some differences between the rate of increase in the value of the futures and the increase in natural gas prices delivered to the utility.

In general, hedging is an effective means of shielding the utility from an increase in natural gas prices. Hedging does not protect against a sustained multi-year increase in natural gas prices, such as experienced from 1997 to 2006 as shown on Table 9. Therefore, the investor-owned utility exposure to increase in natural gas prices may be close to zero in any given year, but Table 11 may illustrate the long-term exposure to increases in natural gas prices for the investor-owned utilities.

Publicly owned utilities LADWP and SMUD apparently have purchased or have plans to purchase natural gas reserves, thereby locking in some or all of their natural gas costs for some time into the future. Table 11 may not apply to LADWP and SMUD. They may be protected from any increase in natural gas costs.

At the workshop, and in comments in response to this report and the workshop, the electric utilities could clarify these issues. They could also provide their estimates of their exposure to increases in natural gas prices.
